Engineering Co-op Program

Education

Bachelor of Science, Software Engineering Co-op
University of Alberta 5-year, Class of 2026

Technical Skills

Programming: Python | Java | Rust | C# | C/C++ | SQL | JavaScript | TypeScript | MATLAB
Tools/Frameworks: Git | Django | React | React Native (Expo) | MongoDB | TensorFlow | PyTorch | Docker | Firebase | Flutter | ASP.NET | Entity Framework Core | PostgreSQL

Work Experience

ATG Sports Management – Full stack Software Developer **May 2025 – August 2025**

- Contributed to the development of a **production React Native (Expo)** application using **TypeScript**, supporting feature delivery across multiple user-facing workflows
- Integrated frontend features with **backend REST APIs** (.NET + PostgreSQL), handling data synchronization, loading states, and error handling in a live environment
- Improved app responsiveness by **13%** by optimizing data fetching through reducing redundant **API** calls, improving request handling, leveraging **caching**, and implementing **pagination**
- Ensured consistent development environments by using **Docker** for local application development and testing

GrowME Marketing – Junior Software Developer **May 2023 – August 2023, May 2024 – December 2024**

- Assisted in the development of a Flutter-based application and resolved issues on live client websites in production
- Improved in-app financial accuracy by fetching and updating cryptocurrency prices every **minute** from the **NDAX API** using a **Firebase** script integrated into a **FlutterFlow** app
- Improved operational efficiency by automating the extraction and reporting of **Google Ads** performance metrics for **100+** clients using a **Django-based** platform
- Resolved production issues on client websites, including routing, frontend (**HTML/CSS**), and backend data-fetching errors
- Transformed manual workflow into an automated system, reducing manual labor by **60%** by leveraging **Google Ads** and **Google Sheets APIs**

Personal & Course Projects

Autonomous Telescope control System– GitHub **April 2026 – August 2026**

- Designed all mechanical components in **Onshape** and 3D printed custom parts, producing a fully functional 2-axis motorized mount with custom motor and gear mounts
- Designed a custom PCB in **KiCad** integrating a **Raspberry Pi**, **STM32**, **GPS module**, and **NEMA stepper motor drivers**, eliminating the breadboard prototype and reducing the system's wiring footprint by **60%**
- Developed firmware in **C** with a custom **UART** protocol for real-time bidirectional communication and motor control
- Built a Python/Flask control layer with gear-ratio compensation and shortest-path azimuth logic, reducing maximum motor travel by up to 50%, with a live web interface for real-time control and monitoring

Student Calendar App (Capstone Project) – GitHub **Jan 2025 – April 2025**

- Developed a student productivity and social engagement application using **Flutter** combined with **Firebase/Firestore**
- Enhanced scheduling accuracy within the app by synchronizing users' Google Calendar events every **2.5 minutes**
- Built a friend recommendation feature using a **graph-based** structure to identify mutual connections and shared context
- Visualized live campus user density within a 5-meter radius using a heatmap to help students find quiet study areas

Android Studio App QRRush – GitHub **Jan 2023 – April 2023**

- Pokémon GO-inspired app where users scan real-world QR codes on an interactive map to earn scores and compete
- Contributed to the design and development of the application's profile page, encompassing both frontend and backend elements, ensuring a seamless user experience, integrating with the backend for **dynamic** content display
- Utilized **Firebase** for **asynchronous** backend services, including server and database management, ensuring robust data storage, real-time data synchronization, and seamless user experience
